

Complexity, mastered.

Complete solutions for data centres, subsea infrastructure and energy integration.

AVENOR turns the client's RFI, RFQ or performance requirement into a coordinated project solution. We bring together the modular data-centre system, energy infrastructure, marine delivery and lifecycle support through a trusted network of specialist partners.

One group. Three connected capabilities.

Data Infrastructure Nearshore, offshore and brownfield data-centre projects, from site and system definition to live operation and planned recovery.

Subsea & Marine Survey, project enablement, cables, installation, inspection, integrity, intervention and recovery.

Energy Integration Power supply, shore and offshore interfaces, resilience and integration with existing energy developments.

The complete delivery solution

The scope can include the modular data centre itself; site investigation; seabed and shore engineering; power and fibre; cables and connections; ports and marine assets; installation and commissioning; operations, maintenance and recovery; and project insurance pathways through specialist providers.

Access. Assets. Assurance.

Access to qualified capability. Assets matched to the requirement. Assurance through clear scope, interface control, quality planning, risk management and agreed acceptance criteria.

Quality, integrity and expertise in practice

We make scope and responsibilities explicit, qualify partners against the project need and keep assumptions visible. Decades of energy-industry delivery experience inform the way each solution is developed and managed.

Bring us the requirement. We will shape the delivery route.
