

SUBSEA & MARINE

Delivering the infrastructure below the waterline.

Protect what exists. Extend what matters. Deliver what comes next.

AVENOR coordinates the marine and subsea work that makes critical infrastructure deliverable, operable and recoverable. We connect qualified specialists, suitable assets and disciplined interface management around the client's scope.

Survey and prepare

Site investigation, hydrographic and geophysical survey, geotechnical investigations, cable-route assessment, UXO risk and clearance services, and project enablement works through qualified contractors.

Install and connect

Port and mobilisation planning, marine logistics, vessel and equipment packages, cable installation and protection, module deployment, subsea connections, inspection and commissioning support.

Protect, extend and recover

Pipeline, power-cable and telecom-cable inspection; monitoring and anomaly assessment; integrity and life-extension programmes; remediation; intervention readiness; controlled decommissioning and recovery.

Supporting the data-infrastructure system

Marine delivery is planned alongside the data-centre, power and fibre packages. Installation methods, connection points, weather access and retrieval arrangements are addressed before they become offshore constraints.

Clear responsibilities from the outset

We establish package boundaries, vessel and equipment requirements, contractor responsibilities, quality and acceptance criteria, and the information required at each interface.

Bring us the asset, location and required outcome.
